Submitted (08-SEP-2000) Genoscope - Centre National de Sequencage, 2 rue Gaston Cremieux, CP 5706, 91057 EVRY cedex, FRANCE. (E-mail: seqrefégenoscope.cns.fr - Web: www.genoscope.cns.fr)
This STS is part of a random genomic sequencing program of thirteen yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces exiguus, Saccharomyces servazzii, Zygosaccharomyces rouxii, Saccharomyces servazzii, Zygosaccharomyces rouxii, Lactis var. lactis, Kluyveromyces thermotolerans, Kluyveromyces narxianus var. marxianus, Pichia angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila, Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to 5 kb were prepared and both extremities were sequenced. See the other extremity of this insert.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Description

The present sequence represents a PCR primer for a geranylgeranyl achieves by synthase has cytostatic activity. A vector encoding GGPP synthase is useful in increasing GGPP synthase levels in a host cell preferably Taxus (Yew) cell and thereby facilitates production, isolation and purification of larger amounts of GGPP synthase is useful in obtaining expression or enhanced expression of GGPP and other diterpenes, such as pacilizat, useful as anticancer drugs. Isolated nucleic acids encoding GGPP synthase or hybridising with GGPP synthase encoding nucleic acids are used for identifying genes encoding GGPP synthase from microorganisms such as Taxomyces andreane and Penicillium raistrickii.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This clone is contained in a DNA construct used to transform host plant cells for regulating the prodn. of the enzyme encoded by pTOM36. Plants such as apple, tomato and mango may be modified to produce e.g. sweeter fruit, novel flavour, modified colour or to have improved processing characteristics. The DNA construct pref. also comprises a constitutive or regulatory promoter, e.g. the CaMV 35S or poly-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DNA constructs contg. DNA from proM36 clone - used to transform plants to regulate prodn. of the fruit-ripening proM36 enzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 1080 BP; 357 A; 141 C; 207 G; 375 T; 0 other;

                                                                                                                                                                                                                                                      with aromatic acyl transferase activity may be used to transform plants which produce anthocyanin pigments. The aromatic acyl transferase acylates the pigments in the flower resulting in colour tone changes and allowing new colourations to be produced. Specific DNA sequences encoding aromatic acyl transferase from different plants are described in AAT37308-173131. This degenerate primer was synthesised base on a peptide fragment (AAW04728) isolated from three of the six clones. It was used to identify

Nucleotide sequence of the fiber protein encoded by adenovirus Ad-36p.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This is the nucleotide sequence encoding the adenovirus Ad-36p fiber protein used in the method of the invention to determine if a person is suffering viral obesity. The method is used to determine whether obesity in a person has a viral basis. Ad-36p can be used as a basis
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Determining if obesity in a person is caused by Ad-36 virus - and providing the basis for treatment or prevention of obesity-causing, cholesterol reducing adenovirus, using the purified variant, Ad-36p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The clone is 1069 bases long with an open reading frame of 271 codons. DNA homologous to pTOM36 may be used in a construct that inhibits expression of genes homologous to pTOM36 during ripening. Fruit from plants transformed with this construct have increased solids content and a higher content of reducing sugars, e.g. glucose and fructose. The fruit may be mangoes, peaches, apples, pears, strawberries, bananas, melons and esp. tomatoes, which are useful in the prodn. of

alcohol acyl transferase, alcohol dehydrogenase, pyruvate decarboxylase, aminotransferase and esterase activities, which are involved in the bisynthetic pathway for allohal dehydrogenase, pyruvate decarboxylase, aminotransferase and esterase activities, which are involved in the bisynthetic pathway for allohalic and/or aromatic ester production in fruit. The nuclectide sequences can be inserted into the genome of a fruit-producing plant to regulate allohatic end/or aromatic ester formation. Aromatic and/or allohatic esters in microorganisms, plant cansferase are produced by inserting thiolase, alcohol acyl ransferase and esterase nuclectide sequences into the genome and feeding the microorganism or plant with alcohol, aldehydes, alpha-keto acids, or amino acids and fatty acids, and acyl-CoA. The nuclectides and their proteins can be used in the processed food industry as food additives to enhance the flavour of syrups, ice-creams, frozan desserts, yoghurts and confectionery. They are used: as flavouring agents for oral medications and vitamins; provide flavour and aroma in beverages, including alcohol; enhance or reduce fruit flavour, aroma, fragrance or scent; enhance the flavour or aroma of natural, synthetic or artificial products; for the production of novel combinations of artificial flavour, profunce or partings and agents; as fragrance or partings of antificial flavour, and apprent or aroma of activity continues or partings of antificial flavour, and agents; as fragrance or partings of antificial flavour, and apprent or aroma or artificial flavour, and aroma or artificial flavour, and aroma or artificial flavour, and aroma or artificial flavour profunces.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             perfumes in cosmetics, creams, sun-protectant products, hair conditioners, lengthening agents and fixatives in perfumes, suspension adds for aluminium salts in anti-perspirant pharmaceuticals, cleaning products, personal care products and animal care products; as disinfectant additives; as degreasing solvents for electronics; as miticides, scabicides, plasticisers and decodorants. Insect repellents, maticides, scabicides, plasticisers and decodorants. The present sequence encodes lemon alcohol acyl transferase, from the present invention.

```
The present invention describes nucleotide sequences with thiolase, alcohol acyl transferase, alcohol dehydrogenase, pyruvate decarboxylase, alcohol acyl transferase, alcohol dehydrogenase, pyruvate decarboxylase, anicohol acyl transferase and esterase activities, which are involved in the biosynthetic pathway for aliphatic and/or aromatic ester production in fruit. The nucleotide sequences can be inserted into the genome of a fruit. The nucleotide sequences can be inserted into the genome of a formation. Aromatic and/or aliphatic esters in microorganism, plant cells or plants are produced by inserting thiolase, alcohol acyl minotransferase, alcohol dehydrogenase, pyruvate decarboxylase, aninotransferase and esterase nucleotide sequences into the genome and feeding the microorganism or plant with alcohol, aldehydes, alpha-keto additives to enhance the flavour of syrups, ice-creams, frozen desserts, caditives to enhance the flavour of syrups, ice-creams, frozen desserts, additives to enhance the flavour of syrups, ice-creams, frozen desserts, including alcohol; enhance or reduce fruit flavour, aroma, fragrance or scent; enhance the flavour or aroma of natural, synthetic or artificial products; for the production of novel combinations of artificial genes; as antibacterial or anti-fungal agents; as fragrance or perfumes in cosmetics, creams, sun-protectant products, as as suspension and along alcohol; enhance and dixatives in perfumes, suspension and softers, creams, sun-protectant products, as a series of a products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

Vectors containing DNA fragments encoding proteins of plant origin with aromatic acyl transferae activity may be used to transform plants which produce anthocyanin pigments. The aromatic acyl transferase acylates the pigments in the flower resulting in colour tone changes and allowing new colourations to be produced. Six specific DNA sequences encoding aromatic acyl transferase from different plants are described in AAT37308-T37313.
                                                                                                                                                                                                                                         which produce anthocyanin pigments and thus altering colour tone, e.g. of flowers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Aromatic acyl transferase; transformation; anthocyanin pigment;

with aromatic act transferase activity may be used to transform plants which produce anthocyanin pigments. The aromatic acyl transferase acylates the pigments in the flower resulting in colour tone changes and allowing new colourations to be produced. Six specific DNA sequences encoding aromatic acyl transferase from different plants are described in AAT3108-173131. NOTE: This sequence is supposed to cross reference with the protein described in AAW04727, however there are so many discrepancies between the polypeptide decoded from this sequence and the polypeptide given in the specification and described in AAW04727 that the indexer decided not to cross reference the two.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cDNA related with fruit ripening - can be used to genetically modify

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                Vectors containing DNA fragments encoding proteins of plant origin with aromatic acyl transferase activity may be used to transform plants which produce anthocyanin pigments. The aromatic acyl transferase acylates the pigments in the flower resulting in colour tone changes and allowing new colourations to be produced. Six specific DNA sequences encoding aromatic acyl transferase from different plants are described in AAT37308-T37313.
                                                                                                                                                                                                                                                      DNA coding for aromatic acyl transferase - for transforming plants which produce anthocyanin pigments and thus altering colour tone, e.g. of flowers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Aromatic acyl transferase; transformation; anthocyanin pigment; plants; acylation; colour; tone; colouration; colour change; Gentiana trifloza; Petunia hybrida; Perilla ocimoides; Scenecio cruentus; Lavandula angustifolia; ds.

                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                                               ö
                                                                    novel ripening-related product from Cucumis melo. It is one of two specified sequences (MEL2) 1526 bp or (MEL7) 686 bp which were 1solated from a melon ripe fruit cDNA library. MEL2 is not a full-length clone; it lacks the initiation codon for the amino terminus. The cDNA allows control of the ripening of fruit, especially melons.
                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Anther specific cDNA or genomic sequences can be used to identify and isolate anther specific promoters. The anther specific promoter can then be cloned into a recombinant construct and used to express heterologous genes. Preferred heterologous genes include Diptheria toxin A-chain gene; pectate lyase gene pelE from Erwinia chrysanthemi; T-urfil from cms-T maize mitochondrial genomes; the Gin recombinase gene from phage Mu; the indole acetic acid-lysine

```

```
CC from Bacillus thuringiensis Israeliensis. All of these genes when CC expressed in anther tissue will result in the inability of the CD plant to produce viable pollen. Transformation of plants with such CC a recombinant construct can produce transgenic, male sterile plants. CC Male sterility is important in the production of hybrid seeds as it CC prevents self pollination which hinders breeding and hybrid seed CC production.

Patent No. 6207815

GENERAL INFORMATION:
APPLICANT: GOURLIE, BRIAN B
APPLICANT: RIXON, MARK W
APPLICANT: RIXON, WARK W
TITLE OF INVENTION: A NOVEL FAMILY OF HIGH AFFINITY,
TITLE OF INVENTION: MODIFIED ANTIBODIES FOR CANCER TREATMENT
NUMBER OF SEQUENCES: 74
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Length 508;

Location/Qualifiers
                                                                                                /note=-Vector: lambda Z1p-Lox; Site_1: Sal; Site_2: Not; Lambda PRL2 is a cDNA library derived from equal quantities of 4 pools of mRNA. The mRNA sources were 1) day germinated etiolated seedlings; 2) tissue culture grown roots; 3) staged plants half with 24 hour light cycle, half on 16 hr light, 8 hour dark- rosettes; 4) same plants as 3 but aerial tissue (stems, flowers and siliques. The vector is BRL's lambda Zip-Lox. The CDNA
                                                                                                                                                                                                                                                                                                                  inserts were directionally cloned with Sal-Not arms using oligo dT primed cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       BG046171 259 bp mRNA EST 25-JAN-2001 saa49e12.y1 Gm-c1060 Glycine max cDNA clone GENOME SYSTEMS CLONE ID: Gm-c1060-215 5' similar to TR:Q43583 Q43583 HSR201 PROTEIN. ;,

from root tissue of 2 week old seedlings for PI468916. Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dT) sequence with a XhoI restriction site. EcoRI adapters were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The cDNA fragments were directionally cloned into the EcoRI. XhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into DH10B host cells (Gibco BRL). This library was constructed in the laboratory of Dr. Randy Shoemaker at Iowa state university."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 (bases I to 263)

CDNA library was constructed from mRNA isolated from very vong cotyledons (20-50mgs fresh weight) of greenhouse groun plants. The library was prepared using the Life Technologies propersoript convaint in the Life Complementary DNA was synthesized from mRNA using a poly(df) sequence with a Not I restriction site. Sal I linker adapters were ligated to the blunt-ended cDNA fragments followed by Not I digestion. The cDNA fragments were directionally cloned into the Not I-Sal I restriction
Eukaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta; Spermatophyta; Magnollophyta; eudicotyledons; core eudicots; Rosladae; eurosida; Fabales; Fabaceae; Papilionoideae; Glycine.

Complementary DNA was synthesized from mRNA using a 3' anchored poly (dT) primer. ECORI adapters were ligated to the blunt-ended cDNA fragments followed by digestion with ECORI and HindIII. The cDNA fragments were directionally cloned into the ECORI-HindIII restriction site of the pT7T3-Pac vector. The ligated cDNA fragments
                                                                                                                                                                                                                                                                                                                                                                  ö
site of the pSPORII vector. The ligated cDNA fragments were transformed into E.coli Electromax DH10B host cells. This library was constructed by Dr. Paul Keim and Dr. Virginia Coryell."

The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gil4732114[gb]AR129072.1), a copy number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and
